

1 Auto-Breaks

This page tests how the TTS engine handles standard LaTeX automatic line breaking. The following paragraph contains long words intended to snap across lines.

The reader should pronounce "incomprehensibilities" and "psy-

2 TTS Hyphenation Test

chophysicists” as single, fluid words, ignoring the visual line break.

Testing: incomprehensibilities psychophysicists uncharacteristically.

2 Soft Hyphens

This page tests the processing of the \- command.

The TTS should not pronounce the hyphens in the following word, even if they appear visually or if the word breaks at that point.

Test Word: manually hyphen-

4 TTS Hyphenation Test

ated demonstration.

If the engine reads "dash" or pauses at every syllable, it fails the soft hyphen test.

3 Hard Hyphens

This page tests explicit hard hyphens in compound words.

1. Mid-line compound:
This is a state-of-the-art system. (Should read naturally).

2. End-of-line split: We are testing a long-term relationship where the break occurs

6 TTS Hyphenation Test

exactly at the hyphen. The TTS must not repeat the hyphen or ignore the second half.

4 Dash Types

TTS engines often confuse hyphens, en-dashes, and em-dashes.

1. Hyphen (-): blue-green algae.

2. En-dash (–): Pages 10–20. (Should read as "ten to twenty").

3. Em-dash (—): The

8 TTS Hyphenation Test

test—assuming it works—should
pause here.

5 Suspended

This tests "suspended" hyphens, where the word is incomplete.

Input: Pre- and post-processing.

TTS Expectation: Read "Pre [pause] and post processing" or "Pre dash and post processing". It should not

10 TTS Hyphenation Test

attempt to merge "Pre" with
"and".

6 Non-Breaking

This tests the tilde character preventing breaks.

We force a break near a reference: Figure 5.

The TTS should read "Figure five" smoothly. The visual layout should force "Figure" and "5" to stay on the

12 TTS Hyphenation Test

same line, preventing an awkward audio pause if split.
